Nomenclature of Organic Compounds — PYQs

This is a SAMPLE set of exam-style questions, written to demonstrate the download feature. Replace this file with your actual previous year question paper via VSCode — keep the same filename so the site picks it up automatically.

Section A — One-mark questions

- 1 Write the IUPAC name of CH_4 .
- 2 Which suffix is used to name a compound containing one triple bond?
- 3 What does the suffix '-ol' indicate in an organic compound's name?
- 4 Write the molecular formula of ethene.

Section B — Two-mark questions

- 1 Write the IUPAC names of $\text{CH}_3\text{-CH}_3$ and $\text{CH}_2\text{=CH}_2$.
- 2 Distinguish between the suffixes '-ane' and '-yne' with one example each.
- 3 Write the structural formula and IUPAC name of the carboxylic acid with two carbon atoms.

Section C — Naming and identification

- 1 Name the following compounds: (a) C_3H_8 (b) C_3H_6 (c) C_3H_4
- 2 Write the IUPAC name of $\text{CH}_3\text{-CH}_2\text{-OH}$ and identify its functional group.
- 3 Write the IUPAC name of $\text{CH}_3\text{-COOH}$ and identify its functional group.
- 4 A compound has the prefix 'But-' and the suffix '-ene'. Write its name, structural formula, and molecular formula.

Section D — Short answer

- 1 Explain, with examples, how the name of an organic compound is built from a prefix and a suffix.
- 2 Why can methane not be named 'methene' or 'methyne'? Explain in terms of the number of carbon atoms.
